Job Title

System Engineer/Platform Engineer/DevOps & Cloud Engineer

Team

Operations Engineering Team

Reports To

Ola/Rob

Job Purpose

Support and maintain the infrastructure and systems that enable the organisation to operate its digital products and services. This is a cross-functional role within the Operations Engineering team focused on modern systems administration, cloud operations, and platform reliability. The position emphasises automation, security, and observability while contributing to DevOps, SecOps, and MLOps practices expected of a modern systems engineer.

Main Responsibilities

System Maintenance and Troubleshooting

- Monitor systems and infrastructure to ensure reliable and efficient operation
- Perform regular system health checks across cloud and on-prem environments
- Identify, troubleshoot, and resolve incidents in a timely manner
- Maintain system reliability, availability, and performance
- Ensure systems and infrastructure remain up-to-date, secure, and scalable
- Participate in incident response and post-incident improvement activities

Infrastructure and Configuration Management

- Provision, configure, and manage cloud and platform infrastructure
- Administer and harden Linux-based systems in production environments
- Manage infrastructure components including compute, networking, storage, and identity
- Maintain system configuration including user access, backups, and monitoring
- Implement and manage Infrastructure as Code (IaC)
- Automate routine system administration and operational tasks

Deployment and Release Management

- Implement and support CI/CD pipelines and release workflows
- Assist with deployment of applications and platform updates to production
- Participate in release planning and coordination
- Ensure release activities are tested, controlled, and repeatable
- Review infrastructure and pipeline changes for reliability and quality

Security and Compliance

- Implement and maintain system and cloud security best practices
- Contribute to security policies, hardening standards, and access controls
- Monitor logs and security events to detect and respond to threats
- Ensure platforms and pipelines meet compliance and governance requirements
- Support secrets management and least-privilege access models

Observability and Continuous Improvement

- Implement monitoring, logging, and alerting across platforms
- Track system performance, availability, and cost in cloud environments
- Champion reliability, automation, and operational excellence
- Maintain thorough technical and operational documentation
- Support MLOps pipelines and platform services where applicable

Key Requirements

Experience:

- Operating Systems Concepts
- Operations Engineering & Networking
- Preferably QA and Testing
- Advanced App Dev (in progress or completed)
- Exposure to Cloud, DevOps, or Systems Administration courses is advantageous

Technical Skills:

- Strong Linux system administration skills (users, services, networking, storage, hardening)
- Practical cloud platform experience (e.g., AWS, Azure, or GCP)
- Experience with Infrastructure as Code (e.g., Terraform or similar)
- Solid understanding of CI/CD pipelines and automation practices
- Familiarity with container technologies (Docker) and orchestration concepts (Kubernetes) is advantageous
- Experience with system monitoring, logging, and observability tools
- Working knowledge of security best practices and access control models
- Experience with automated and manual software testing in delivery pipelines
- Familiarity with development toolchains (git, GitHub, package management)
- Basic scripting ability (Bash or Python) for automation tasks
- Understanding of MLOps concepts is advantageous

Personal Attributes

- Strong interpersonal and communication skills
- Clear ability to explain and document technical work
- Strong team player with a reliability and security mindset
- Proactive learner willing to upskill in unfamiliar areas
- Comfortable working with external Studio stakeholders

Additional Information

If you have any questions, see Ola/Rob.

Application Process

Submit CV and cover letter to Moodle. Include only relevant information in your CV. Please specify your first and second choice of team in your cover letter.
