

ITN Practice Lab

Instructions

1. Configure the above in packet tracer.
2. Configure all IP addressing as per supplied networks in the diagram (You choose allocation within each subnet). Include PC IP addresses, router interfaces, switch management (VLAN 1)
3. Ensure to configure both routers with: console password, telnet password, enable secret, encrypt plain text passwords, banner, hostname, interfaces have meaningful descriptions.
4. Remember to configure default gateways on the PCs and switches.

Testing

1. All devices within each LAN should be able to ping all other devices within the same LAN.
 2. Can PCs in LAN A ping PCs in LAN B (& vice versa)?
- There is a problem in that the routers by default only know about directly connected networks. Use the 'ip route' command both routers to solve (known as a static route)
- Syntax = ip route <destination network> <mask> <next hop ip address>
